Note: In division, **0 can never be the divisor** because you cannot make 0 groups of a number and you cannot distribute a number of things 0 ways. **If 0 is the dividend, the answer is always 0**, no matter what the divisor is.

Dividend – the number of things to be grouped *or* distributed (it's the number you start with)

Divisor – the number of groups you are making *or* the number of ways you are distributing the items represented by the dividend.
